NEBRASKA WEEKLY WEATHER AND CROP REPORT

Released 11-13-56

Week Ending 11-10-56

WEATHER October was considerably warmer than usual. Average temperatures ranged from slightly above normal over the northwestern corner of the State to more than 6° above in the southeastern corner. The month was very dry over the Panhandle, where large areas received no precipitation of consequence. Elsewhere the precipitation averaged only slightly below normal, except over the north-central and central portions of the State, where most stations received a little more than normal precipitation. The month was very dry until the last few days, when most of the precipitation occurred.

Cold weather prevailed during the first half of the week, with hard freezing over the western portion of the State Tuesday morning, and over the entire State Thursday morning. This was the first hard freeze of the season over the eastern portion of the State, and the first freezing temperature of the season at several southeastern and extreme east-central localities. Unseasonably warm weather prevailed during the latter half of the week. There was considerable wind movement, almost full sunshine and humidity was low during the latter part of the week.

CROPS Winter wheat improved slightly in much of the wheat areas South of the Platte River since moisture was received. High winds blew most of the snow off winter wheat fields in the Panhandle. Moisture received last week followed by that of the previous week in the eastern third of the State improved the condition of winter wheat. More moisture is needed throughout the State. The condition of rye improved slightly during the past week.

11-13-56 1,350
All but 12% of the corn harvest is completed. The percentages of corn harvested in the leading districts are as follows: Northeast, 56%; Central, 89%; East-central, 97%; Southwest, 71%; South central, 91%; Southeast, 55%. The snow storm delayed harvesting in the Panhandle and North central Nebraska. Yields of corn are slightly better than expected. More than the usual amount of gleaning was done due to previous dry weather and high winds causing the corn to drop to the ground.

There is no change in the indicated yield of grain sorghum. The yield of soybeans is slightly higher than that indicated a month ago.

The sugar beet harvest is nearly completed. The sugar content is above the average. The yield of dry edible beans is slightly below previous expectations. The yield of potatoes was slightly larger than that of a year ago. The shipments of 506 cars are slightly above shipments a year ago this date.

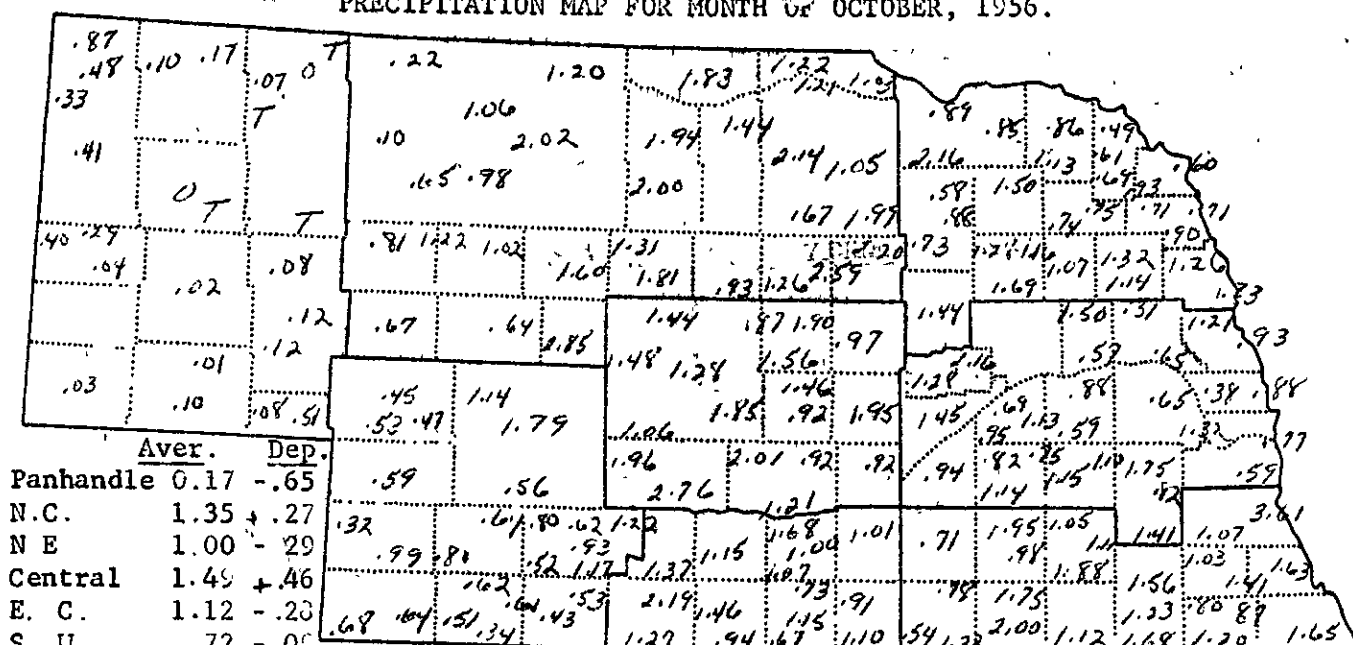

The moisture of the past weeks was too late to improve the pastures. However, it improved the quality of the range feed, making it more palatable. Dry weather causes the range feed to become quite brittle and some of it was broken off. Moisture was of considerable benefit in the Sandhills. Shipments of hay have been quite large in some areas. Reports indicate shortages of feed in some areas.

LIVESTOCK Lack of feed has caused more than the usual amount of marketings of livestock. Prices of eggs are still very low and unsatisfactory. Cattle on feed are below that of a year ago but numbers were larger than expected under the shortage of feed and grain.
